---

---

---

---

---

---

---

---

2

---

---

---

---

---

---

---

---

3

---

---

---

---

---

---

---

---

History

JavaScript, often abbreviated as JS, is a **high-level, dynamic, weakly typed, object-based, and interpreted programming language**

Alongside HTML and CSS, JavaScript is one of the three core technologies of World Wide Web content production

It is used to make webpages interactive and provide online programs, including video games

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

4

---

---

---

---

---

---

---

---

History

Although there are strong outward similarities between JavaScript and Java, including language name, syntax, and respective standard libraries, the two languages are distinct and differ greatly in design

Although it was developed under the name Mocha, the language was officially called LiveScript when it first shipped in beta releases of Netscape Navigator 2.0 in September 1995

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

5

---

---

---

---

---

---

---

---

History

It was renamed JavaScript when it was deployed in the Netscape Navigator 2.0 beta 3 in December

The final choice of name caused confusion, giving the impression that the language was a spin-off of the Java programming language

The choice has been characterized as a marketing ploy by Netscape to give JavaScript the cachet of what was then the hot new Web programming language

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

6

---

---

---

---

---

---

---

---

## History

- 1994: Mosaic Netscape 0.9 released
- By 1995, Netscape commanded ¾ of the browser market / became the main browser of the 1990s
- Subsequently renamed Netscape Navigator (Mosaic became Netscape Communications)

7

---

---

---

---

---

---

---

---

## History

- Soon realized that the Web should be more dynamic
- 1995: NSC recruited Brendan Eich / wrote first version prototype in 10 days (May)
- Microsoft got into the game with Jscript and included support for CSS and various extensions to HTML

8

---

---

---

---

---

---

---

---

## History

- The competition between Netscape and Microsoft led to non-standard implementations

- November 1996, Netscape submitted JavaScript to Ecma\* International to carve out a **standard** specification, which other browser vendors could then implement based on the work done at Netscape

\* European Computer Manufacturers Association

9

---

---

---

---

---

---

---

---

**History**

Ecma International is an industry association founded in 1961 and dedicated to the standardization of Information and Communication Technology (ICT) and Consumer Electronics (CE). [History](#)

The aims of Ecma are:

- To develop, in co-operation with the appropriate National, European and International organizations Standards and Technical Reports in order to facilitate and standardize the use of Information Communication Technology (ICT) and Consumer Electronics (CE)
- To encourage the correct use of Standards by influencing the environment in which they are applied
- To publish these Standards and Technical Reports in electronic and printed form; the publications can be freely copied by all interested parties without restrictions

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

10

---

---

---

---

---

---

---

---

**History**

- The standards process continued in cycles, with the release of ECMAScript 2 in June 1998
- The release of ECMAScript 3 followed in December 1999, which is the baseline for modern day JavaScript
- At first, Microsoft seemed to participate and even implemented some of the proposals in their JScript .NET language
- With all the haggling back and forth, the Open Source community became involved

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

11

---

---

---

---

---

---

---

---

**History**

- 2005: Open source libraries released supporting JavaScript (e.g., Prototype, jQuery, Dojo Toolkit, and others)
- 2008 Oslo Meeting: agreement in early 2009 to standardize

These are the high points...as you can imagine, a lot happened over 14 years, and beyond, to lead us to the JavaScript in use today

# First Things First

The Document Object Model (DOM)

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

13

---

---

---

---

---

---

---

---

## First Things First: Understanding the DOM

When a web page is loaded, the browser creates a **Document Object Model (DOM)** of the page

The **HTML DOM** model is constructed as a tree of **Objects**

14

---

---

---

---

---

---

---

---

## First Things First: Understanding the DOM

With the object model, JavaScript gets all the power it needs to create dynamic HTML:

- JavaScript can change all the HTML elements in the page
- JavaScript can change all the HTML attributes in the page
- JavaScript can change all the CSS styles in the page
- JavaScript can remove existing HTML elements and attributes

15

---

---

---

---

---

---

---

---

## First Things First: Understanding the DOM

With the object model, JavaScript gets all the power it needs to create dynamic HTML:

JavaScript can add new HTML elements and attributes

JavaScript can react to all existing HTML events in the page

JavaScript can create new HTML events in the page

16

---

---

---

---

---

---

---

---

## First Things First: Understanding the DOM

17

---

---

---

---

---

---

---

---

## First Things First: Understanding the DOM

18

---

---

---

---

---

---

---

---

# First Things First: Understanding the DOM

```

<!DOCTYPE html>
<html>
<head>
<title>My title</title>
</head>
<body>
<h1>My header</h1>
<a href="#">My link</a>
</body>
</html>

```

This is how the browser 'sees' the web page  
 By assigning **ids** to elements, we can use JavaScript to access (and modify) them

19

---

---

---

---

---

---

---

---

---

---

# First Things First: Understanding the DOM

```

<!DOCTYPE html>
<html>
<head>
<title>My title</title>
</head>
<body>
<h1>My header</h1>
<a href="#">My link</a>
</body>
</html>

```

It should also be evident that the DOM can grow to be extremely complex as the complexity of a given page increases

20

---

---

---

---

---

---

---

---

---

---

# Classes and IDs

21

---

---

---

---

---

---

---

---

---

---

## Classes and IDs

We've seen throughout our exploration of CSS frameworks how important classes are to styling web pages

IDs are the primary way in which JavaScript accesses and dynamically modifies web pages and their elements

There is some bleed-over, however:

CSS can style IDs

JavaScript can access elements by class

22

---

---

---

---

---

---

---

---

## Simple Example

One of the many JavaScript methods is `getElementById()`

This method is part of the `document` class and is thus invoked using dot (".") notation (One of the language's similarities with Java), i.e.,

23

---

---

---

---

---

---

---

---

## Simple Example

```

<h2>What Can JavaScript Do?</h2>
<p id="demo">
Short cuts make delays, <br>
but inns make longer ones.
</p>
<button type="button" onclick="document.getElementById('demo').innerHTML = 'Frodo'>Who?
</button>

```

What Can JavaScript Do?

Short cuts make delays,  
but inns make longer ones.

Who?

What Can JavaScript Do?

Frodo  
Who?

24

---

---

---

# JS - Including With HTML

The `<script>` Element

In HTML, JavaScript code must be inserted between `<script>` and `</script>` tags

```

<body>
  <h2>JavaScript in Body</h2>
  <p id="demo"></p>
  <script>
    document.getElementById("demo").innerHTML =
    "Do not meddle in the affairs of Wizards, for" +
    "<br>they are subtle and quick to anger.";
  </script>
</body>

```

**JavaScript in Body**  
Do not meddle in the affairs of Wizards, for they are subtle and quick to anger.

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

26

---

---

---

---

---

---

---

---

# JS - Including With HTML

JavaScript Functions and Events

A JavaScript function is a block of JavaScript code, that can be executed when "called" for

For example, a function can be called when an event occurs, like when the user clicks a button

We will talk more about functions and events later

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

27

---

---

---

---

---

---

---

---

## JS - Including With HTML

JavaScript in `<head>`

In this example, a JavaScript function is placed in the `<head>` section of an HTML page

The function is invoked (called) when a button is clicked

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

28

---

---

---

---

---

---

---

---

## JS - Including With HTML - `<head>`

```

<head>
<script>
function myFunction() {
  document.getElementById("demo").innerHTML =
  "Gurney Halleck, Dune";
}
</script>
</head>
<body style="font-family:sans-serif;">
<h2>JavaScript in Head</h2>
<p id="demo">
  If wishes were fishes, we'd all cast nets
</p>
<button type="button" onclick="myFunction()">Who?</button>
</body>
    
```

**JavaScript in Head**  
If wishes were fishes, we'd all cast nets  
Who?

**JavaScript in Head**  
Gurney Halleck, Dune  
Who?

East Tennessee State University

---

---

---

---

---

---

---

### JS - Including With HTML - <body>

```

<body>
<h2>JavaScript in Body</h2>
<p id="demo">
Happiness consists in getting enough sleep.<br>
Just that, nothing more.
</p>
<button type="button" onclick="myFunction()">
Who?
</button>
<script>
function myFunction() {
document.getElementById("demo").innerHTML =
"Robert A. Heinlein";
}
</script>
</body>

```

JavaScript in Body

Happiness consists in getting enough sleep.  
Just that, nothing more.

Who?

JavaScript in Body

Robert A. Heinlein

Who?

East Tennessee State University Department of Computing CSCI 1720 Intermediate Web Design

31

---

---

---

---

---

---

---

---

---

---

### JS - Including With HTML

External JavaScript

Scripts can also be placed in external files

External scripts are practical when the same code is used in many different web pages

JavaScript files have the file extension **.js**

To use an external script, put the name of the script file in the **src** (source) attribute of a **<script>** tag

East Tennessee State University Department of Computing CSCI 1720 Intermediate Web Design

32

---

---

---

---

---

---

---

---

---

---

### JS - Including With HTML - External Example

```

<p id="demo">
Never attempt to teach a pig to sing;
it wastes your time and annoys the pig.
</p>
<button type="button" onclick="myFunction()">
Who?
</button>
<p>(myFunction is stored in an external
file called "myScript.js")</p>
<script src="myScript.js"></script>

```

Never attempt to teach a pig to sing;  
it wastes your time and annoys the pig.

Who?

(myFunction is stored in an external  
file called "myScript.js")

Robert A. Heinlein

Who?  
(myFunction is stored in an external  
file called "myScript.js")

East Tennessee State University Department of Computing CSCI 1720 Intermediate Web Design

33

---

---

---

---

---

---

---

---

---

---

## JS - Including With HTML

External scripts can be referenced with a full URL or with a path relative to the current web page

This example uses a relative URL to link to a script

34

---

---

---

---

---

---

---

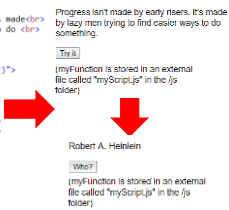

---

## JS - Including With HTML - External

```

<p id="demo">
Progress isn't made by early risers. It's made<br>
by lazy men trying to find easier ways to do <br>
something.
</p>
<button type="button" onclick="myFunction()">
Try it!
</button>
<p>
(myFunction is stored in an external<br>
file called "myScript.js" in the /js<br>
folder)
</p>
<script src="js/myScript.js"></script>

```

35

---

---

---

---

---

---

---

---

## JS - Including With HTML

External JavaScript Advantages

- Separates HTML and code
- Makes HTML and JavaScript easier to read and **maintain**
- Cached JavaScript files can speed up page loads

To add several script files to one page - use several script tags

```

<script src="myScript1.js"></script>
<script src="myScript2.js"></script>

```

36

---

---

---

---

---

---

---

---

# JavaScript Output

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

37

---

---

---

---

---

---

---

---

# JS Output

JavaScript can "display" data in different ways:

- Writing into an HTML element, using `innerHTML`
- Writing into the HTML output using `document.write()`
- Writing into an alert box, using `window.alert()`
- Writing into the browser console, using `console.log()`

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

38

---

---

---

---

---

---

---

---

# JS Output - innerHTML

To access an HTML element, JavaScript can use the `document.getElementById("id")` method

The `id` attribute identifies the HTML element

The `innerHTML` property defines the HTML content

Changing the `innerHTML` property of an HTML element is a common way to display data in HTML

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

39

---

---

---

---

---

---

---

---

### JS Output - innerHTML Example

```

<h2>Isaac Asimov</h2>
<p id="demo"></p>
<script>
document.getElementById("demo").innerHTML =
"I do not fear computers.<br>" +
"I fear the lack of them.";
</script>

```

**Isaac Asimov**  
I do not fear computers.  
I fear the lack of them.

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

40

---

---

---

---

---

---

---

---

### JS Output - document.write()

For testing purposes, it is convenient to use document.write()

```

<h2>Isaac Asimov</h2>
<script>
document.write("Isaac Asimov quote<br>" +
"Should appear here.");
</script>

```

**Isaac Asimov**  
Isaac Asimov quote  
Should appear here

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

41

---

---

---

---

---

---

---

---

### JS Output - window.alert()

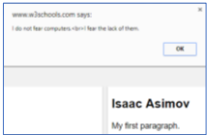

You can use an alert box to display data

```

<h2>Isaac Asimov</h2>
<script>
window.alert("I do not fear computers.<br>" +
"I fear the lack of them.");
</script>

```

Note: The alert box appears as a drop-down box at the top of the browser window. The button must be clicked in order to return to the page (Pressing 'Enter' also works)

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

42

---

---

---

---

---

---

---

---

# JavaScript Syntax

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

43

---

---

---

---

---

---

---

---

# JS Syntax

JavaScript syntax is the set of **rules**, how JavaScript programs are constructed

- A computer program is a list of **instructions** to be **executed** by the computer
- In a programming language, these program instructions are called **statements**
- JavaScript is a programming language
- JavaScript statements are separated by semicolons

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

44

---

---

---

---

---

---

---

---

# JS Syntax - Statements

JavaScript statements are composed of **Values, Operators, Expressions, Keywords, and Comments**

The JavaScript syntax defines two types of values: **Fixed values** and **variable values**

- Fixed values are called **literals**
- Variable values are called **variables**

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

45

---

---

---

---

---

---

---

---

## JS Syntax - Statements

JavaScript statements are composed of **Values, Operators, Expressions, Keywords, and Comments**

The JavaScript syntax defines two types of values: **Fixed values** and **variable values**

Fixed values are called **literals**

Numbers are written with or without decimals: **10.50 / 1001**

Strings are text, using either single or double quotes:  
`"Hello JS!" / 'Hello JS!'`

East Tennessee State University  
 Department of Computing

CSCI 1720  
 Intermediate Web Design

46

---

---

---

---

---

---

---

---

## JS Syntax - Statements

In a programming language, variables are used to store data values

JavaScript uses the `var` keyword to declare **variables**

An equals sign is used to assign **values** to **variables**

East Tennessee State University  
 Department of Computing

CSCI 1720  
 Intermediate Web Design

47

---

---

---

---

---

---

---

---

## JS Syntax

Variable Declaration

var

X, y, z;

Variable Assignment

{

X = 5;

y = 6;

z = X + y;

In HTML, JavaScript programs are executed by the web browser

East Tennessee State University  
 Department of Computing

CSCI 1720  
 Intermediate Web Design

48

---

---

---

---

---

---

---

---

## JS Syntax - Statements

JavaScript uses arithmetic operators (+ - \* /) to compute values

(Again this is identical to how Java and other programming languages depict operators)

The equals sign (=) is referred to as the **assignment operator**; it 'assigns' a value to a variable

49

---

---

---

---

---

---

---

---

## JS Syntax - Statements

An **expression** is a combination of **values**, **variables**, and **operators**, which computes to a **value**

The computation is called an evaluation

For example, 5 \* 10 evaluates to 50

```
<p>Expressions compute to values.</p>
<p id="demo"></p>
<script>
document.getElementById("demo").innerHTML = 5 * 10;
</script>
```

Expressions compute to values.  
50

50

---

---

---

---

---

---

---

---

## JS Syntax - Statements

An **expression** is a combination of **values**, **variables**, and **operators**, which computes to a **value**

The **computation** can also include variables

```
<p>Expressions compute to values.</p>
<p id="demo"></p>
<script>
var x;
x = 5;
document.getElementById("demo").innerHTML = x * 10;
</script>
```

Expressions compute to values.  
50

51

---

---

---

---

---

---

---

---

## JS Syntax - Statements

An **expression** is a combination of **values**, **variables**, and **operators**, which computes to a **value**  
 The values can be of various types, such as numbers and strings  
 For example, "John" + "" + "Doe", evaluates to "John Doe"

```
<p>Expressions compute to values.</p>
<p id="demo"></p>
<script>
document.getElementById("demo").innerHTML =
"John" + "" + "Doe";
</script>
```

Expressions compute to values.  
John Doe

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

52

---

---

---

---

---

---

---

---

## JS Syntax - Keywords

JavaScript keywords are used to identify actions to be performed  
 The **var** keyword tells the browser to create variables

```
var x, y;
x = 5 + 6;
y = x * 10;
```

You can't use a keyword as a variable name

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

53

---

---

---

---

---

---

---

---

## JS Syntax – Keywords

None of these words can be used as a variable name  
 Some may be legitimately part of a name, however:

```
var in; NO!
var inTable; OK
```

|          |            |              |           |
|----------|------------|--------------|-----------|
| abstract | arguments  | await*       | boolean   |
| break    | byte       | case         | catch     |
| char     | class*     | const        | continue  |
| debugger | default    | delete       | do        |
| double   | else       | enum*        | eval      |
| export*  | extends*   | false        | final     |
| finally  | float      | for          | function  |
| goto     | if         | implements   | import*   |
| in       | instanceof | int          | interface |
| let*     | long       | native       | new       |
| null     | package    | private      | protected |
| public   | return     | short        | static    |
| super*   | switch     | synchronized | this      |
| throw    | throws     | transient    | true      |
| try      | typeof     | var          | void      |
| volatile | while      | with         | yield     |

East Tennessee State University  
Department of Computing

CSCI 1720  
Intermediate Web Design

54

---

---

---

---

---

---

---

---

## JS Syntax - Comments

Not all JavaScript statements are "executed"  
Code after double slashes // or between /\* and \*/ is treated as a comment  
Comments are ignored, and will not be executed

```
var x = 5; // I will be executed

// var x = 6; I will NOT be executed
```

Somebody, **please**, tell me **why** this is important

55

---

---

---

---

---

---

---

---

## JS Syntax - Comments

```
function myhide(obj) {
  try {
    obj.style.display = 'none';
  } catch (e) {
  }
}

function myhide(obj) {
  /** summary=this method will hide the DOM object specified in 'obj' */summary:
  /** returns type="void" */
  /** @param name="obj" type="object" should contain a DOM object/param
  try {
    obj.style.display = 'none';
  } catch (e) {
    // Something went wrong, we will ignore here
  }
}
```

Quick! What does this do?

56

---

---

---

---

---

---

---

---

## JS Syntax - Identifiers

Identifiers are names  
In JavaScript, identifiers are used to name variables (and keywords, and functions, and labels)  
The rules for legal names are much the same in most programming languages  
In JavaScript, the first character must be a letter, or an underscore (\_), or a dollar sign (\$)   
Subsequent characters may be letters, digits, underscores, or dollar signs  
Numbers are not allowed as the first character (Why?)

57

---

---

---

---

---

---

---

---

### JS Syntax - Case Sensitivity

All JavaScript identifiers are **case sensitive**  
The variables `lastName` and `lastname`, are two different variables

```
var lastname, lastName;  
lastName = "Doe";  
lastname = "Peterson";
```

58

---

---

---

---

---

---

---

---

### JS Syntax - Camel Case

Historically, programmers have used different ways of joining multiple words into one variable name

Hyphens:

first-name, last-name, master-card, inter-city  
**\*Hyphens are not allowed in JavaScript. They are reserved as the subtraction operator**

Underscore:

first\_name, last\_name, master\_card, inter\_city

59

---

---

---

---

---

---

---

---

### JS Syntax - Camel Case

Upper Camel Case (Pascal Case):

FirstName, LastName, MasterCard, InterCity

60

---

---

---

---

---

---

---

---

## JS Syntax - Camel Case

Lower Camel Case:  
 JavaScript programmers tend to use camel case that starts with a lowercase letter

firstName, userLastName, masterCard, homeCity

---

## JS Statements

In HTML, JavaScript statements are **instructions** to be **executed** by the web browser

```
<p>In HTML, JavaScript statements are executed by the browser.</p>
<p id="demo"></p>
<script>
  document.getElementById("demo").innerHTML = "Dave: Open the pod bay doors, HAL." +
  "<br>HAL: I'm sorry, Dave. I'm afraid I can't do that.";
</script>
```

Statement

Execution

In HTML, JavaScript statements are executed by the browser.  
 Dave: Open the pod bay doors, HAL.  
 HAL: I'm sorry, Dave. I'm afraid I can't do that.

## JS Programs

Most JavaScript programs contain many JavaScript statements  
The statements are executed, one by one, in the same order as they are written  
(Note: function calls)

64

---

---

---

---

---

---

---

---

## JS Programs

In this example x, y, and z are given values, and finally z is displayed

```
<p>  
  JavaScript code (or just JavaScript) <br>  
  is a sequence of JavaScript statements  
</p>  
  
<p id="demo"></p>  JavaScript code (or just JavaScript)  
is a sequence of JavaScript statements  
  
<script>  
  var x, y, z;  
  x = 5;  
  y = 6;  
  z = x + y;  
  document.getElementById("demo").innerHTML = z;  
</script>
```

65

---

---

---

---

---

---

---

---

## JavaScript Variables

66

---

---

---

---

---

---

---

---

## JS Variables

JavaScript variables are containers for storing data values

In this example, x, y, and z, are variables

```
var x = 5;    x stores the value 5
var y = 6;    y stores the value 6
var z = x + y; z stores the value 11
```

Much like Algebra

67

---

---

---

---

---

---

---

---

## JS Variables

```
var price1 = 5;
var price2 = 6;
var total = price1 + price2;
```

In programming, just like in algebra, we use variables (like price1) to hold values

In programming, just like in algebra, we use variables in expressions (total = price1 + price2)

From the example above, you can calculate the total to be 11

68

---

---

---

---

---

---

---

---

## JS Identifiers

All JavaScript variables must be identified with unique names

These unique names are called identifiers

Identifiers can be short names (like x and y) or **more descriptive** names (age, sum, totalVolume)

The general rules for constructing names for variables (unique identifiers) are:

- Names can contain letters, digits, underscores, and dollar signs.

- Names can begin with a letter

- Names can also begin with \$ and \_

- Names are case sensitive (y and Y are different variables)

- Reserved words (like JavaScript keywords) cannot be used as names

69

---

---

---

---

---

---

---

---

## JS Assignment Operator

In JavaScript, the equal sign (=) is an "assignment" operator, not an "equal to" operator

This is different from algebra. The following does not make sense in algebra

$$x = x + 5$$

In JavaScript, however, it makes perfect sense: it assigns the value of  $x + 5$  to  $x$

(It calculates the value of  $x + 5$  and puts the result into  $x$ . The value of  $x$  is incremented by 5.)

70

---

---

---

---

---

---

---

---

## JS Data Types

JavaScript variables can hold numbers like 100 and text values like "John Doe"

In programming, text values are called text strings

JavaScript can handle many types of data, but for now, just think of numbers and strings

Strings are written inside double or single quotes. Numbers are written without quotes

If you put a number in quotes, it will be treated as a text string

71

---

---

---

---

---

---

---

---

## JS Data Types

```
var pi = 3.14;
var person = "John Doe";
var answer = 'Yes I am!';
```

In this example,

The value 3.14 is assigned to a variable named 'pi'

The value "John Doe" is assigned to a variable named 'person'

The value "Yes I am!" is assigned to a variable named 'answer'

72

---

---

---

---

---

---

---

---

## JS Data Types

Creating a variable in JavaScript is called **declaring** a variable

You declare a JavaScript variable with the var keyword  
`var carName;`  
After the declaration, the variable has no value  
(Technically it has the value of undefined)

`carName = "Volvo";`

To assign a value to the variable, use the equal sign

73

---

---

---

---

---

---

---

---

## JS Data Types

You can also assign a value to the variable when you declare it `var carName = "Volvo";`

`<p>`  
Create a variable, `<br>`  
assign a value to it, `<br>`  
and display it:  
`</p>`

`<p id="demo"></p>`

`<script>`  
`var carName = "Volvo";`  
`document.getElementById("demo").innerHTML = carName;`  
`</script>`

Create a variable,  
assign a value to it,  
and display it:  
Volvo

74

---

---

---

---

---

---

---

---

## JS Data Types

You can declare many variables in one statement

Start the statement with `var` and separate the variables by comma

`var person = "John Doe", carName = "Volvo", price = 200;`

75

---

---

---

---

---

---

---

---

## JS Data Types

In computer programs, variables are often declared without a value

The value can be something that has to be calculated, or something that will be provided later, like user input

A variable declared without a value will have the value undefined

If you re-declare a JavaScript variable, it will not lose its value
